

PHP PRACTICAL ASSESSMENT

Session + Login System + Product CRUD Dashboard

Duration	2 Hours 15 Minutes	Total Marks	50
Technology	PHP + MySQL + HTML + Bootstrap	Level	Intermediate

Project Objective

Create a complete PHP/MySQL application with **two separate database tables**. The first table, **users**, must be used only for registration and login authentication. The second table, **products**, must be used for the actual CRUD operations. After login, the student must display a protected product dashboard where products can be inserted, updated and deleted.

Database Design

Table 1 — users — Registration and Login Only

Field	Requirement
id	Primary Key, Auto Increment
first_name	VARCHAR / text field
last_name	VARCHAR / text field
username	VARCHAR / text field
email	VARCHAR / text field
phone	VARCHAR / text field
city	VARCHAR / text field
gender	ENUM('Male','Female','Other')
password	Store using password_hash()

Table 2 — products — CRUD Operations

Field	Requirement
product_id	Primary Key, Auto Increment
product_name	VARCHAR / text field
category	VARCHAR / text field
price	Suitable numeric field
quantity	Suitable integer field
brand	VARCHAR / text field
description	VARCHAR/TEXT field

Important: The **users** table and **products** table must be separate. Registration/login must work with the users table. Insert, Update, Delete and the dashboard table must work with the products table.

Required Pages / Project Structure

Page	Required Work
db.php	Connect PHP to the MySQL database and reuse the connection.
register.php	Register a user into the users table. Minimum 6 text fields + Gender dropdown.
login.php	Login using username and password from the users table.
home.php	Session-protected product dashboard. Display navbar, logged-in username and products table.
insert.php	Insert a new product into the products table.
update.php	Fetch and update an existing product.
delete.php	Delete an existing product.
logout.php	Destroy the session and redirect to login.php.

1. Registration — users Table

- Create register.php with a minimum of six text-based fields.
- Include a Gender dropdown containing Male, Female and Other.
- Store Gender in the users table as an ENUM column.
- Insert registration data into the users table.
- Store the password using password_hash().
- The registration page must not insert product information.

2. Login + PHP Session — users Table

- Create login.php containing Username and Password.
- Check the credentials against the users table.
- Use password_verify() to verify the password.
- Use session_start() and store the logged-in user's username in \$_SESSION.
- Redirect the user to home.php after successful login.

3. Home / Product Dashboard — products Table

- Create a navigation bar at the top.
- Display: Hello, [username] using the username stored in the session.
- Provide links/buttons for Add Product, Update Product, Delete Product and Logout.
- Display product records from the products table in an HTML table.
- The table must show Product ID, Product Name, Category, Price, Quantity, Brand and Description.
- The dashboard must display the product data — not the users table.

4. Product Insert

- Create insert.php.
- Create a form containing all required products-table fields except the auto-increment product_id.
- Insert the submitted product into the products table.
- After insertion, redirect to home.php and display the new product.

5. Product Update

- Create update.php.
- Allow the student to select a product using product_id.
- Update the selected product in the products table.
- Show the updated product on the dashboard.

6. Product Delete

- Create delete.php.
- Allow the student to select a product using product_id.
- Delete the selected product from the products table.
- After deletion, return to the dashboard and show the remaining products.

7. Logout

- Create logout.php.
- Destroy/unset the active PHP session.
- Redirect the user to login.php.
- After logout, directly opening home.php must not show the product dashboard.

Product Data Requirement — 10 to 20 Records

The **products** table must contain a minimum of **10 products** and a maximum of **20 products** for the assessment demonstration. These records must be used to demonstrate the CRUD operations.

- Minimum product records: 10
- Maximum product records: 20
- Dashboard must display the stored product records.
- Insert at least one new product during demonstration.
- Update at least one existing product during demonstration.
- Delete at least one existing product during demonstration.
- The users table is separate and is not counted as part of the 60–70 product records.
